.NET User Engine

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

User Engine.NET is a User Signup and Authentication system which only requires simple configuration. User Engine uses Microsoft Access 2000 Database to store user information and logs date and time of user logins, as well as login counts. Also allowing users to signup with fully validated inputs to protect against SQL injection. Further features are 'Remember Me' option using cookies to allow users to stay logged in until manually logging out and template based error pages. Secure your web pages by adding a small ASP header which redirects the user to the login page if not signed in.
