Email	{value_email}

oMail is a Perl-based Web front end to qmail/vmailmgrd using MySQL. Features include: mailbox/alias management, autoresponder support, changing passwords, and support for French, English, and German. The way it works is: the maildomain administrator logs in with domain name and unix account password, these info are stored in a sql session table with an expiration time, for every "system" request, the suid wrapper (vwrap.pl) is called, and on logout or after expiration, the session is removed from the table.
