Personal Online Database (POD) is a powerful C++ cgi script to create and manage online databases. The interface to access the database is fully customizable - Write your own html pages completely to your taste or use included templates. Database can be searched and sorted in various modes, password protected on whole file or individual entry level. Add, change, delete entries and administer DB configurations online. The DB is scalable, and its hardware/software failure protection and concurrency handling make it a reliable and high throughput DB application. It supports different data types and can automatically generate counting statistics for individual entries and report errors and statistics by html email. It can also convert existing DB files (in csv format) to format recognized by POD.
