Online Wizard for Converting HTML Table to Delimited Text File

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This is an ASP/DHTML-designed online wizard for converting HTML table to text file with user specified delimiter. You may use this wizard to convert html table generated from SQL Server in an internet or an intranet system to text file with a user specified delimiter. A link between SQL Server and an internet/intranet creates real_time and user_defined information from SQL Server. Additionally, webmaster or administrator can save this text file as plain text file for unix system database, since user already specified the delimiter for this file. You can further extend the functionality of this wizard to build a query from database as recordset. That enables you to work with multiple tables and views to create your own text report.
