PageForward is a proxy browsing program written in PHP that lets the user view web pages through a 'proxy server' (the server the script is running on.) PageForward uses cURL to remotely fetch pages, and then displays them on the user's screen--making it an ideal tool to bypass internet content filters at work or school, or to just browse anonymously. Version 1.5 now includes the ability to load images through the proxy. Visit joshdick.net for a live demo of PageForward.
