

# Performance Metrics for the ASP Response Object

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

This article takes a look at three different ways to output content using Response.Write: using context switching, simple Response.Write statements, and Response.Write statements within a With block. Also examines the performance implications of each approach as well as the timing results of the vanilla Response.Write approach in an ASP.NET Web page.
