Perl Debug Wrapper Script

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

The wrapper executes a given script internally and prints out EVERY error to the browser that might occur. Use it when you move perl applications from server to server as well when scripting or adapting perl scripts. It will save you a lot of headache and time especially when you're not allowed to access the webserver's error logfile.
