[PHP\_Debug] An open source PHP debug library Hi, i have motivated myself to write this debug class, it works pretty fine. :) Here what the class allows : - Pear integration - PHP Process time - Database and query process time - Dump of all type of variable in a graphical way - Functionnal debug - Debug queries - Show number of database queries executed - Allow to search in all debug infos - Direct links to test queries in Phpmyadmin - Show globals var ( \$GLOBALS, \$\_POST, \$\_GET ... ) - Enable or disable the debug infos you want to see - Check performance of chunk of php code - Customize the general display of your debug - ... ( see doc for complete specification ) - You can check full doc website : ( nice phpdoc documentation :p ) If you have questions, ideas, etc..., contact at my Website. It is very clear and well documented ( with Pear::Phpdocumentor ) Now i am searching people to test and to have some feedback, the next realease will depend on the feedback i will get. For php beginner what is really great for example is the ability to show all queries and to have a direct link to test this quesries in phpmyadmin.. :) I am waiting for your comments, it would be nice if some people would use it. But anyway i use already it. :p
