PHP2Go is a development framework designed to help experient developers and begginer programmers to create Web-based Systems. It's and object-oriented, structured and hierarchical set of classes and libraries developed using PHP, XML and JavaScript. The main goal of PHP2Go is to be a complete code repository to build systems with code reuse, object orientation, separation between logic and presentation code and database transparency. All the components of the API have the same purpose: to create an object oriented abstraction layer that runs over the powerful PHP API, providing an organized, structured and easier way to create HTML documents, HTML forms, database or file data sets, reports, HTML templates and much more. Visit the project home page to get more information, including help tips and online demos.
