PhpLens is a PHP Application Server for rapidly creating database driven Web applications. With phpLens, data can be presented as html tables with facilities to create, edit, paginate, search and delete records. Over 150 properties for modifying phpLens behaviour are provided. Developers can use phpLens in two ways, as a PHP class that is called from PHP code; or they can build their Web application directly from a browser based wizard interface called the Grid Builder and then generate the PHP code. PhpLens works with many databases: MySQL, PostgreSQL, Oracle, Microsoft SQL Server, Microsoft Access, FoxPro, Interbase, Sybase, and many others (including DB2 and Progress through ODBC). Also integrated with Smarty template engine. **New in 2.0:** Inline editing of multiple rows in the data grid, and popup hot updates which dynamicly change based on your selection.
