PhpMyLibrary is a PHP/MySQL Web based library automation application. The program consists of cataloging (for handling adding/editing/deleting/searching of materials), circulation (so the librarian can handle user related management items), and the webpac module (where the World searches the catalog of your library). Also has an import export feature, and strictly follows the USMARC standard for adding materials. Update: Multi-admin support. Library user picture upload. Database restructured. polGenSQL revised. Content Management Added. The ISIS2MARC application has been added to speed up converiting CDS/ISIS records into MARC format. polGenSQL function allows the librarian to convert MARC data to sql commands compatible to PhpMyLibrary database structure.
