

PostJump

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

The main use that I have found is in setting a module as your start page and being able to pass it variables (example: PostWrap). Under PostNuke Administration, Settings, you can set your Start Page (The module, index.php is pointing to), but the modules are in a dropdown box and that doesn't allow variables to be passed to the module. PostJump supports both PHP and JavaScript redirects. The default is PHP.
