

# Selective enable/disable form elements

<b>Address</b>	<code>{value_address}</code>
<b>Contact Person</b>	<code>{value_contact_person}</code>
<b>Mobile Number</b>	<code>{value_mobile_number}</code>
<b>Email</b>	<code>{value_email}</code>

While you can achieve the same functionality by writing some amount of JavaScript for each such field, this plug-in makes it a breeze. It takes only two parameters and does the same for you in just one line of code.
