

Send E-Mail via ASP without CDONTS

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This package includes ASP code to write e-mail messages to a file and a VB application that checks this file for messages at specified intervals and sends them. This solution is useful if you don't have CDONTS installed on your web server, or you want to send e-mail asynchronously without loading an object into IIS's process space. The included documentation explains how the solution works, how to implement it, and provides an example.
