Mobile Number	{value_mobile_number}
Email	{value_email}

Stunnix JS-Obfus protects your JavaScript code from potential analyzing/studying/reworking by unwanted parties. It's both an obfuscator (mangler/cruncher/scrambler) and encoder for the JavaScript source code, with advanced support for ensuring licensing conditions (script expiration, binding script to a set of servers, generic checks and actions). It converts the JavaScript/JScript source files into highly mangled and obfuscated form, making it extremely difficult to study, analyse, reuse, and re-work for competitors or customers, while fully retaining functionality of the original source code, and then encodes it afterwards, making it completely unreadable. There are a lot of options to control all aspects of code hiding, and full support for all syntax constructs. Both client-side and server-side code can be protected, in raw .js files, in .asp or .html files. It is designed to be multi-module aware. Comes with advanced cross-platform browser-based user interface that allows to protect even huge and complex projects in a several clicks of mouse. Utility for extraction symbols from ActiveX components included.
