

# TotalCount

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

The all-in-one package to display a counter on your website! Its totally up to you how you use it. It has two modes of operation, the first being text based where the count is returned simply as a number and the second being where graphics are displayed showing the hitcount. We don't force you to hard-coded graphics or even one particular type of graphic, all you do is upload the 10 pictures (0->9.extension) of any file type and state what they are, the script does the rest - you don't have to worry. As far as security is concerned and bogus hit counts, if somebody calls the script from a location which you have not setup to log then don't worry because your not going to get any increased hits - you choose what to log and each page has its own individual hit count for overall ease of use.
