The Transform Image UI (User Interface) is a CSS3 & Javascript based component that will transform an image live on-screen according to user actions. Resize, rotate & flip (horizontal and vertical) options are all available, allowing the image to be transformed in a dynamic, user friendly and interesting way. When the user is happy with their transforms and the image is as they'd like, the hidden form fields can be submitted (such as when the user clicks a button to confirm their transform actions are complete) and of course used by a another script to take further action, such as using perhaps ASP.net or PHP to actually apply those transforms to an image on the web server.
