

Validate Dates using Javascript

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

In this tutorial we will be creating a prototype method in Javascript that will help us validate any date entered from the user's input. The function will take two arguments: Argument 1: Target Delimiter. e.g. how the user should separate the digits. Common delimiters are '/' or '-'. Argument 2: Target Format. The order of the year (y), the month (m) and the day (d). Common formats are 'mdy', or 'ymd'.
