Webdata is an easy database program specifically for the world wide web. It uses your web browser to add, modify, or delete entries into your database. All you have to do is upload 2 files to your Unix server, and type 'perl install.pl'. It will ask you some questions about your server, what password you want, and what field names you want. That's it. It generates a maintenance page called 'admin.html' from which you can immediatly begin adding records. Guests will be able to search by any combination of criteria to suit their needs.
