Mobile Number	{value_mobile_number}
Email	{value_email}

XODA is a DMS (Document Management System) written in PHP and using AJAX. It uses no database backend, though allows adding/editing descriptions and filters to files and directories, downloading files over HTTP, uploading files to the server, as well as performing regular actions like copying, moving, renaming and deleting. It uses user identification. The password, settings and labels can be user-friendly set over the browser. The project targets end-users who want to organize all kind of documents on a remote machine running a webserver with a PHP support. Though advanced users are encouraged to contribute changes. The goal was therefore to write the code hacker-friendly. XODA is lightweight (just few files) including compressed JavaScript and stores the "meta information" in php-files.
