XYGraph was created to generate intelligent plots of output data without the need for extensive user input. Take a look at the demo page to see just how useful and professional the results are. The script generates an XY Graph using Vector Markup Language (VML) and returns an html string for display via javascript. The code is written to automatically calculate appropriate scaling for tics and will cut off extreme data points. Noncommercial use is free, donations are appreciated. A modest one-time licensing fee will be asked for commercial use.
