Mobile Number	{value_mobile_number}
Email	{value_email}

Zone Pricing is a proper tool to adjust product prices that relate to specific territories. In other words, the extension allows setting of different prices on a particular item in different markets (countries/regions/cities). By switching the options you can determine zone pricing: by country; by region/state and by zip/postal code. Of course, you will be able to leverage all of these options at the same time in cases if you want to get more complex pricing models. This way you will be able to set different prices of a certain product either for different countries or for different states/regions/provinces of the same country or for different cities situated in the same state/region/province. You can vary the prices by entering either percentage values or fixed amount. Your visitors' location is detected by Customer Locator (a supplemental module) which, in turn, may be also configured in an appropriate way.
