The Access Maintainer utility is designed to automate the maintenance of Microsoft Access database files (.mdb) in the Windows environment. Its purpose is to find and compact databases thereby reducing wasted disk space and increasing the performance of applications using those databases. The utility is extremely valuable in environments where there are many separate Microsoft Access databases which are added to, and deleted from on a regular basis. Features include: Scheduler (set and forget) - specify the cycle e.g. once per week, and the start time, Search - every drive / file path specified will be searched for new or modified databases, and Log - all processing operations are logged and displayed. See how much disk space you are saving.
