AurigaDoc is a java-xml-xsl based documentation tool for writing xml documents and converting them to other formats like HTML, DHTML, RTF and PDF. AurigaDoc can produce output in HTML(single and multi-page), DHTML, PDF, RTF, PostScript, HTML Help, Java Help, Oracle help For Java, Unix Man Page, etc. The idea is to keep a single document source(as xml) and convert it to various formats using XSLT. This is an upgraded release. In these release some bugs have been fixed and some new features have been introduced. These include - Profiling: Generating different output from same source by passing parameters - Creating a document Index - Including files using XInclude.
