CFTAGLIB is a simple methodology that is focused on organizing ColdFusion custom tags in a logical manner. It also has a main focus of providing ColdFusion developers with easy to use documentation on the ColdFusion custom tags we develop. Macromedia provided a nice Component Browser (available if you have the RDS password) that automatically provides documentation for CFCs on your server. Provided you organize your CFCs in a logical manner, this documentation interface is invaluable. However, Macromedia did not provide the same type of utility for our custom tags. CFTAGLIB aims to bring this same type of browser to our custom tags. In addition to the documentation benefits, new development concepts within ColdFusion MX are taken advantage of. These concepts of packages and tag libraries come to us by way of the J2EE environment ColdFusion now runs in. However, you do not need to know any Java to use either the CFTAGLIB methodology or application. As it stands right now, CFTAGLIB is still a work in progress. The core exists right now and is usable. With use and feedback from the developer community, CFTAGLIB will evolve.
