This is the ColdFusion Directory Image Gallery. The Directory Image Gallery is a dynamic script that generates an image gallery by reading folder names and content. The folder names are the titles of the individual galleries and the pictures are pulled from the folder. The application can contain sub-directories or sub-folders to help categorize albums. Their is a built in navigation to help navigate back to higher levels of a directory. This application is offered in a CFMX7 and a CF8 version along with a Windows and Linux version. The main difference in the CF8 version is the use of only one directory with thumbnails created on the fly, while the CFMX7 relies on mirror directories; one for the whole sized pictures and one for the thumbnails.
