Drupal is an open-source platform and content management system for building dynamic web sites offering a broad range of features and services including user administration, publishing workflow, discussion capabilities, news aggregation, metadata functionalities using controlled vocabularies and XML publishing for content sharing purposes. Equipped with a powerful blend of features and configurability, Drupal can support a diverse range of web projects ranging from personal weblogs to large community-driven sites. Due to its modular design Drupal is flexible and easy to adapt or extend. The Drupal platform, written in PHP and utilizing a database back end (e.g. MySQL or PostgreSQL database) provides APIs that facilitate the development of building blocks (modules) that seamlessly integrate with each other.
