This unique system enables users to log-on and build quality web sites with plug-n-play e-commerce tools. Once created, users are able to log-on and manage, change or update both the look and feel of the web site and any of the sites' content – as often as they'd like. All of this is accomplished without ever leaving the web and without the need for any programming or design experience. Listed below are many of the "core features" available in all GenaWeb® products. For a detailed list of available features click [here](#). Live web creation and content management - GenaWeb® allows all users to create and manage web sites in their native environment – the Internet. There exists no separate procedure for publishing and uploading changes. Every service begins and ends live and on-line. Fully expandable – Each version of GenaWeb® is fully and seamlessly expandable to accommodate any number of users and web sites. Version updates are virtually made obsolete by the use of the GenaWeb® Upgrade Center. Plug-n-Play Components - GenaWeb®'s flexible component architecture allows "drag and drop" placement of unlimited components such as guest registration utilities, press release items, calendars, maps and the like – no programming required. WYSIWYG development – Throughout both the design and editing phases of web site development the user can "Preview " choices to enable a "What You See Is What You Get" (WYSIWYG) development environment. Flexible design architecture - GenaWeb®'s flexible design architecture enables the entire system to be re-configured to meet a wide variety of commercial applications. Roles-Based Security - With roles-based security, each user, developer or designer may be assigned a different "role" that defines what content they may access and edit. This allows multiple users to participate in the management of web content within the same site or sites, while maintaining central control. The Content Bin - GenaWeb® employs a unique concept called the "Content Bin" to store web site content. This feature allows users to share images, text, links and other content across multiple web sites without having to ever enter the content a second time.
