Email	{value_email}

jqSajax is simple way to call PHP function/method from javascript. You can use it as jQuery Plugin, so we can call php function/method as: `var result=$.x_phpfunction(var1,var2);` or you can call like: `var result=$.x_object_method( var1,var2);` Example: to call `helloworld($var1,$var2)` function in PHP , you can write input button like this: jQuery Ajax return a page (data type is XML,JSON,text,script,html ,etc), jqSajax return the result of PHP function/method you call. the variable type is the same the variable type in PHP. you can pass all variable types: array,string,number,boolean from javascript to PHP and vice versa. with jqSajax you can pass and get array (from javascript to PHP and vice versa) easier. The demo is placed in http://satoewarna.com/jqs_ajax
