

MailWebForm

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

MailWebForm processes a HTML form, composes an e-mail and delivers it. A great feature is MailWebForm's spam protection: The recipient's address is not specified in the HTML form; MailWebForm uses a well protected mechanism (property files) to get the mail's destination. Of course flexibility and ease-of-use are MailWebform's design goals. MailWebForm accepts three levels of parameter input: A global property file, user property files and HTML form input. The setup is easily done through a administration web site. It uses Java Servlet API (version 2.3+ required), Java Mail API (version 1.3+) and JRE (version 1.3.1+).
