

## Parse html with preg\_match\_all

Address {value\_address}

Contact Person{value\_contact\_person}Mobile Number{value\_mobile\_number}

**Email** {value\_email}

For the most of the PHP scripter which are using preg\_match or preg\_replace frequently is the function preg\_match\_all a smaller advantage, but for all others it's maybe hard to understand. The biggest difference between preg\_match\_all and the regular preg\_match is that all matched values are stored inside a multi-dimensional array to store an unlimited number of matches.
