QuickHP is a kind of content management system with a new approach. It uses XML and XSLT to provide a compatible source format and very different target formats. The user interface allows comfortable file handling and features like file history (versioning), preview of parsed files and efficient parsing (by parsing only changed files). Furthermore, QuickHP provides a solution to the problem that XML files cannot contain dynamic content (e.g. PHP code), because then the valid XML content would be broken - no problem with QuickHP: XML files that contain PHP code are parsed through the XSL template on-the-fly. The authors homepage is an example of possibilities of QuickHP.
