

# Send an Email with ASP/PHP/Perl

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

Assuming your flash IDE is open already let's go ahead and get started. In this tutorial we'll cover sending emails through flash using a server side script in ASP, PHP, or Perl we will cover all three. With this you can add email functionality to your flash website for endless possibilities. There are a few things to note here. It is a very wise choice to restrict some aspects of this application. Allowing users to decide where the email is going can lead to some serious headaches. By giving users that ability you open yourself to the user using it for anonymous emails, so be careful.
