webnotebook is a small CGI script whose purpose is to replace the omnipresent stack of small pieces of paper which clutter every desk. It simply lets you add, view, edit, and delete each record via the browser. On accessing webnotebook you will see a "short" view of every "page" on the stack, presented as a table. You can quickly find information you want here. The "text" field is truncated to 150 characters to speed up displaying the table. It also comes with a search engine. It uses a MySQL database on backend and requires DBI/DBD perl modules.
